Technical problem

3 pts

1. Anna spends all of her income on shirts and jeans \( J \). Anna’s preferences can be represented by the utility function \( U(S,J) = S^{0.4}J^{0.6} \).

- Derive the demand functions for shirts and jeans in terms of the price of shirts \( P_S \) the price of jeans \( P_J \), and income \( I \).
- Suppose the price of a shirt is $4, the price of a pair of jeans is $12, and Anna has $200 income. What bundle of shirts and jeans \((S,J)\) maximizes Anna’s utility?
- Suppose we double both prices What happens to Anna’s utility?
